

WIPRO CAPSTONE PROJECT

Automation Testing Project

Make My Trip Booking

Domain Name: Booking System

Name	Modules
Chetan Yadav	Travel Insurance
Ayush Jaiswal	Buses
Shivam Maurya	Flights
Harsh Vardhan Singh	Train
Mangu Sreya Bhavani	Hotels
Durgam Deekshita	Cruise

Module Name: Travel Insurance

Objective-This capstone project aims to build a scalable BDD automation framework using Selenium and Cucumber to validate end-to-end travel booking workflows. Key objectives include writing human-readable Gherkin feature files, implementing a reusable Page Object Model, handling complex dynamic elements, and generating detailed execution reports with failure screenshots.

Flow of End to End

1. Open the MakeMyTrip website.
2. Close the initial login popup.
3. Open the travel insurance page.
4. Input data for destination and number of travelers, then click on explore.
5. Choose a plan.
6. Fill details like name, date of birth, email, mobile number, and gender.
7. Click on the buy button.
8. When the login popup opens, enter your mobile number, click the checkbox, and hit the continue button.

Positive Test Scenarios

- Check for International Travel + Medical Insurance & Assistance
- Check for Choose plan for your Trip
- Check Traveller Details
- Check for Form filled

Negative Test Scenarios

- Check error for blank DOB
- Check error for blank mobile number
- Check error for wrong mobile number

Module Name: Buses

Objective: Develop an automation testing framework for the MakeMyTrip Buses module using Selenium WebDriver with Pytest and BDD Behave frameworks to validate bus search, route verification, filter handling, seat selection, booking validation, and payment navigation with Data-Driven Testing, Allure Reporting, logging, and screenshot capturing.

Flow of End to End

1. Launch MakeMyTrip application
2. Close login popup
3. Navigate to Buses module
4. Enter source and destination city
5. Select journey date and search buses
6. Apply AC filter
7. Select available bus and seat
8. Verify boarding and dropping points
9. Enter passenger details
10. Proceed to payment page
11. Enter card details
12. Close the browser

Positive Test Scenarios

- Route Validation
- Sleeper Filter Validation
- Seat Selection Verification
- Booking Page Route Validation

Negative Test Scenarios

- Same Source and Destination Validation
- No Buses Found Validation

Module Name: Flights

Objective: Automate and validate the end-to-end booking workflow for the Flights module on MakeMyTrip using Selenium + Pytest and BDD + Behave frameworks. The framework verifies search workflows, booking flow validations, filtering capabilities, passenger restrictions, and responsive interactions across multiple scenarios.

Flow of End to End

1. Launch MakeMyTrip application
2. Handle overlay modal
3. Navigate to Flights module
4. Select trip type (One Way)
5. Enter source and destination cities
6. Select departure date
7. Execute flight search
8. Open fare details, “View Prices”
9. Proceed with “Book Now” flow
10. Validate booking page redirection
11. Add passenger details
12. Enter contact information
13. Validate required field behavior
14. Confirm booking.

Positive Test Scenarios

- One-Way Flight Search Validation
- Dynamic City Selection
- Non-Stop Flight Filter Validation
- Airline Filter Verification (Example: Air India)

Negative Test Scenarios

- Infant Restriction Validation
[Verify error when number of infants exceeds adults.]
- Same Source and Destination
[Verify error when same city are selected.]

Module Name: Trains

Objective: The main goal of this project was to make sure the entire train ticket booking process works perfectly from start to finish. To achieve this, I wrote an automated script that acts like a real user. It automatically searches for train routes, picks an available seat, and fills in all the passenger details using information saved in Excel files. Finally, the script double-checks that the website safely makes it to the final payment page without freezing or showing any errors.

Flow of End to End

1. Launch MakeMyTrip application
2. Close login popup
3. Navigate to Trains module
4. Enter source and destination stations
5. Select travel date and search trains
6. Apply AC and Available filters
7. Select available train ticket
8. Open add traveller modal and enter passenger details
9. Enter IRCTC username and contact details
10. Accept terms and proceed to payment
11. Select credit card option and enter details
12. Close the browser

Positive Test Scenarios

- Valid Source & Destination Search
- Train Listing & Availability Validation
- AC and Available Filter Validation
- Payment Page Navigation Validation

Negative Test Scenarios

- Invalid Source and Valid Destination Search
- Invalid Mobile Number Validation

Module Name: Hotels

Objective: The Hotel Module Automation Framework validates the complete hotel booking process of MakeMyTrip using Selenium with Python. It automates hotel search, guest details entry, hotel selection, and checkout validation. The framework uses POM architecture, Pytest execution, and CSV-based data-driven testing for multiple scenarios.

Flow of End to End

1. Launch MakeMyTrip application
2. Handle Login popup
3. Navigate to Hotel module
4. Enter Destination or City
5. Enter Stay dates
6. Add Rooms & Guests
7. Click on Search Parameter
8. Apply 5-Star Filter
9. Selects First Hotel From Hotel Listings
10. Clicks On Book This Now
11. Add Guest Details
12. Selects Secure Trip Option
13. Click On Pay Now

Positive Test Scenarios

- Guest Details Validation From Csv Data
- Dynamic City Selection
- Entering Correct Pan-Number
- Applying 5-Star Filter

Negative Test Scenarios

- Invalid PAN Card Format Validation
- Empty First Name

Module Name: Cruise

Objective: Streamline and verify the complete cruise booking journey and cross-domain transitions to mmt.odysol.com by deploying a Selenium and BDD-based automation framework.

Flow of End to End

1. Launches the Make My Trip Website
2. Intermittent Modal Handling
3. Entering cruise tab
4. Search Parameter Injection
5. Cross-Domain Handshake
6. Filter Verification and selects the first cruise
7. Cabin Selection
8. Guaranteed Booking page
9. Passenger Matrix Processing
10. Contact Details and Dining options
11. Injection of PAN ID and proceed
12. Checkout page with price details
13. Teardown & Artifact Capture

Test Summary

Positive Test Scenarios

- Integration Flow (E2E)
- Lowercase PAN ID Auto-Sanitization
- Dynamic Sorting & Selection by Departure Date
- Financial Price Validation
- UI Responsiveness & Window Switching

Negative Test Scenarios

- Invalid PAN Card Format Validation
- Required Field Validation (First Name Omitted)

DELIVERABLES

1. AUTOMATION FRAMEWORK

Selenium WebDriver + PyTest + Behave BDD with Page Object Model (POM) architecture.

2. TEST COVERAGE

End-to-End, Positive & Negative test cases across all team modules .

3. ALLURE REPORTS

Professional HTML reports with step-by-step execution flow, screenshots & history.

4. SCREENSHOT EVIDENCE

Automated screenshot capture at each key execution stage for audit & debugging.

5. EXECUTION LOGS

Detailed Python logging for execution tracking and failure diagnosis, the log reports were made.

6. GITHUB REPOSITORY

Full codebase with README, feature files, page objects, and data files version-controlled.

THANK YOU
